This tutorial introduces the concept of regular expressions and describes their usage in Java. It also provides several Java regular expression examples.

1. Regular Expressions

1.1. What are regular expressions?

A *regular expression* defines a search pattern for strings. The abbreviation for regular expression is *regex*. The search pattern can be anything from a simple character, a fixed string or a complex expression containing special characters describing the pattern. The pattern defined by the regex may match one or several times or not at all for a given string.

Regular expressions can be used to search, edit and manipulate text.

The process of analyzing or modifying a text with a regex is called: *The regular expression is applied to the text/string*. The pattern defined by the regex is applied on the text from left to right. Once a source character has been used in a match, it cannot be reused. For example, the regex `aba` will match `ababababa` only two times (`aba_aba__`).

1.2. Regex examples

[Consulting \(https://www.vogella.com/consulting/\)](https://www.vogella.com/consulting/)

[Company \(https://www.vogella.com/company/\)](https://www.vogella.com/company/)

A simple example for a regular expression is a (literal) string. For

example, the *Hello World* regex matches the "Hello World" string.

[Contact us \(https://www.vogella.com/contact.html\)](https://www.vogella.com/contact.html)

(dot) is another example for a regular expression. A dot matches any

single character; it would match, for example, "a" or "1".

The following tables lists several regular expressions and describes which pattern they would match.

Table 1. Regex example

Regex	Matches
this is text	Matches exactly "this is text"
this\s+is\s+text	Matches the word "this" followed by one or more whitespace characters followed by the word "is" followed by one or more whitespace characters followed by the word "text".
^d+(\.d+)?	^ defines that the pattern must start at beginning of a new line. d+ matches one or several digits. The ? makes the statement in brackets optional. \. matches ".", parentheses are used for grouping. Matches for example "5", "1.5" and "2.21".

(https://www.vogella.com/training/eclipse/)

1.3. Support for regular expressions in programming languages

Regular expressions are supported by most programming languages, e.g., Java, Perl, Groovy, etc. Unfortunately each language supports regular expressions slightly different.

2. Prerequisites

The following tutorial assumes that you have basic knowledge of the Java programming language.

Some of the following examples use [JUnit Tutorial](https://www.vogella.com/tutorials/JUnit/article.html)

(https://www.vogella.com/tutorials/JUnit/article.html) to validate the result.

You should be able to adjust them in case if you do not want to use JUnit.

3. Rules of writing regular expressions

(https://www.vogella.com/) be a references for the different regex elements.

[Consulting \(https://www.vogella.com/consulting/\)](https://www.vogella.com/consulting/)
[Company \(https://www.vogella.com/company/\)](https://www.vogella.com/company/)
[GET MORE...](#)

3.1. Common matching symbols

[Contact us \(https://www.vogella.com/contact.html\)](https://www.vogella.com/contact.html)

Regular Expression	Description	
.	Matches any character	<ul style="list-style-type: none"> • Read Premium Content ... (https://learn.vogella.com) • Book Onsite Training (https://www.vogella.com/training/onsite/)
^regex	Finds regex that must match at the beginning of the line.	<ul style="list-style-type: none"> • Consulting (https://www.vogella.com/consulting/)
regex\$	Finds regex that must match at the end of the line.	<p>TRAINING EVENTS</p> <ul style="list-style-type: none"> • Cross Mobile App Dev. Schulung in Hamburg (https://www.vogella.com/training/appdev/) • Eclipse RCP Dev. Schulung in Hamburg (https://www.vogella.com/training/eclipse/)
[abc]	Set definition, can match the letter a or b or c.	
[abc][vz]	Set definition, can match a or b or c followed by either v or z.	
[^abc]	When a caret appears as the first character inside square brackets, it negates the pattern. This pattern matches any character except a or b or c.	
[a-d1-7]	Ranges: matches a letter between a and d and figures from 1 to 7, but not d1.	
X Z	Finds X or Z.	
XZ	Finds X directly followed by Z.	
\$	Checks if a line end follows.	

3.2. Meta characters

The following meta characters have a pre-defined meaning and make certain common patterns easier to use. For example, you can use `\d` as simplified definition for `[0..9]`.

Regular Expression	Description
<code>\d</code>	Any digit, short for <code>[0-9]</code>
<code>\D</code>	A non-digit, short for <code>[^0-9]</code>
<code>\s</code>	A whitespace character, short for <code>[\t\n\r\b\f]</code>
<code>\S</code>	A non-whitespace character, short for
<code>\w</code>	A word character, short for <code>[a-zA-Z_0-9]</code>

(<https://www.vogella.com/>)

[Consulting](https://www.vogella.com/consulting/) (<https://www.vogella.com/consulting/>)

[Company](https://www.vogella.com/company/) (<https://www.vogella.com/company/>)

[Contact us](https://www.vogella.com/contact.html) (<https://www.vogella.com/contact.html>)

<code>\w</code>	A non-word character [<code>^\w</code>]
<code>\S+</code>	Several non-whitespace characters
<code>\b</code>	Matches a word boundary where a word character is [a-zA-Z0-9_]

• [Read Premium Content ...](#)

(<https://learn.vogella.com>)

• [Book Onsite Training](#)

(<https://www.vogella.com/training/onsite/>)

• [Consulting](#)

(<https://www.vogella.com/consulting/>)

These meta characters have the same first letter as their representation, e.g., digit, space, word and boundary. Uppercase symbols define the opposite.

(<https://www.vogella.com/training/appdev/>)

• [Eclipse RCP Dev. Schulung in Hamburg](#)

(<https://www.vogella.com/training/eclipse/>)

3.3. Quantifier

A quantifier defines how often an element can occur. The symbols `?`, `*`, `+` and `{}` are qualifiers.

Regular Expression	Description	Examples
<code>*</code>	Occurs zero or more times, is short for <code>{0,}</code>	<code>X*</code> finds no or several letter X, <code><sbr />.*</code> finds any character sequence
<code>+</code>	Occurs one or more times, is short for <code>{1,}</code>	<code>X+</code> Finds one or several letter X
<code>?</code>	Occurs no or one times, <code>?</code> is short for <code>{0,1}</code> .	<code>X?</code> finds no or exactly one letter X
<code>{X}</code>	Occurs X number of times, <code>{}</code> describes the order of the preceding liberal	<code>\d{3}</code> searches for three digits, <code>.{10}</code> for any character sequence of length 10.
<code>{X,Y}</code>	Occurs between X and Y times,	<code>\d{1,4}</code> means <code>\d</code> must occur at least once and at a maximum of four.

3.4. Grouping and back reference

You can group parts of your regular expression. In your pattern you group elements with round brackets, e.g., (). This allows you to assign a repetition operator to a complete group.

In addition these groups also create a back reference to the part of the regular expression. This captures the group. A back reference stores the part of the `String` which matched the group. This allows you to use this part in the replacement.

Via the `$` you can refer to a group. `$1` is the first group, `$2` the second, etc.

Let's, for example, assume you want to replace all whitespace between a letter followed by a point or a comma. This would involve that the point or the comma is part of the pattern. Still it should be included in the result.

```
// Removes whitespace between a word character and . or ,
String pattern = "(\\w)(\\s+)([\\.\\,])";
System.out.println(EXAMPLE_TEST.replaceAll(pattern, "$1$3"));
```

JAVA

This example extracts the text between a title tag.

```
// Extract the text between the two title elements
pattern = "(?i)(<title.*?>)(.+?)( )";
String updated = EXAMPLE_TEST.replaceAll(pattern, "$2");
```

JAVA

3.5. Negative look ahead

Negative look ahead provides the possibility to exclude a pattern. With this you can say that a string should not be followed by another string.

Negative look ahead are defined via `(?!pattern)`. For example, the following will match "a" if "a" is not followed by "b".

```
a(?!b)
```

JAVA

3.6. Specifying modes inside the regular expression

TRAINING EVENTS

- [Cross Mobile App Dev. Schulung in Hamburg](#)
(https://www.vogella.com/training/appdev/)
- [Eclipse RCP Dev. Schulung in Hamburg](#)
(https://www.vogella.com/training/eclipse/)

(<https://www.vogella.com/>)

Consulting (<https://www.vogella.com/consulting/>) **Company** (<https://www.vogella.com/company/>)

- (?i) makes the regex case insensitive.

- (?s) for "single line mode" makes the dot match all characters, including line breaks.

Contact us (<https://www.vogella.com/contact.html>)

- (?m) for "multi-line mode" makes the caret and dollar match at the start and end of each line in the subject string.

(<https://learn.vogella.com>)

- [Book Onsite Training](#)

(<https://www.vogella.com/training/onsite/>)

- [Consulting](#)

(<https://www.vogella.com/consulting/>)

3.7. Backslashes in Java

The backslash `\` is an escape character in Java Strings. That means

backslash has a predefined meaning in Java. You have to use double

backslash `\\` to define a single backslash. If you want to define `\w`,

then you must be using `\\w` in your regex. If you want to use `\` as a literal, you have to type `\\\\` as `\` is also an escape

character in regular expressions.

4. Using regular expressions with String methods

4.1. Redefined methods on String for processing regular expressions

`Strings` in Java have built-in support for regular expressions.

`Strings` have four built-in methods for regular expressions, i.e., the

`matches()`, `split()`, `replaceFirst()` and `replaceAll()`

methods. The `replace()` method does NOT support regular expressions.

These methods are not optimized for performance. We will later use classes which are optimized for performance.

Method	Description
<code>s.matches("regex")</code>	Evaluates if "regex" matches s. Returns only true if the WHOLE string can be matched.
<code>s.split("regex")</code>	Creates an array with substrings of s divided at occurrence of "regex". "regex" is not included in the result.
<code>s.replaceFirst("regex"), "replacement"</code>	Replaces first occurrence of "regex" with "replacement".
<code>s.replaceAll("regex"), "replacement"</code>	Replaces all occurrences of "regex" with "replacement".

Create for the following example the Java project `de.vogella.regex.test`.

```

public static final String EXAMPLE_TEST = "This is my small
example string which I'm going to use for pattern
matching.";

public static void main(String[] args) {
    System.out.println(EXAMPLE_TEST.matches("\\w.*"));
    String[] splitString = (EXAMPLE_TEST.split("\\s+"));
    System.out.println(splitString.length); // should be 4
    for (String string : splitString) {
        System.out.println(string);
    }
    // replace all whitespace with tabs
    System.out.println(EXAMPLE_TEST.replaceAll("\\s+",
"\t"));
}
}

```

4.2. Examples

The following class gives several examples for the usage of regular expressions with strings. See the comment for the purpose.

If you want to test these examples, create for the Java project `de.vogella.regex.string`.

5. Pattern and Matcher

For advanced regular expressions the `java.util.regex.Pattern` and `java.util.regex.Matcher` classes are used.

You first create a `Pattern` object which defines the regular expression. This `Pattern` object allows you to create a `Matcher` object for a given string. This `Matcher` object then allows you to do regex operations on a `String`.

```

package de.vogella.regex.test;

import java.util.regex.Matcher;
import java.util.regex.Pattern;

public class RegexTestPatternMatcher {
    public static final String EXAMPLE_TEST = "This is my small
example string which I'm going to use for pattern matching.";

    public static void main(String[] args) {
        Pattern pattern = Pattern.compile("\\w+");
        // in case you would like to ignore case sensitivity,
        // you could use this statement:
        // Pattern pattern = Pattern.compile("\\s+",
        Pattern.CASE_INSENSITIVE);
        Matcher matcher = pattern.matcher(EXAMPLE_TEST);
        // check all occurrence
        while (matcher.find()) {
            System.out.print("Start index: " +
matcher.start());
            System.out.print(" End index: " + matcher.end() + "
");
            System.out.println(matcher.group());
        }
        // now create a new pattern and matcher to replace
        whitespace with tabs
        Pattern replace = Pattern.compile("\\s+");
        Matcher matcher2 = replace.matcher(EXAMPLE_TEST);
        System.out.println(matcher2.replaceAll("\t"));
    }
}

```

6. Java Regex Examples

The following lists typical examples for the usage of regular expressions. I hope you find similarities to your real-world problems.

6.1. Or

Task: Write a regular expression which matches a text line if this text line contains either the word "Joe" or the word "Jim" or both.

Consulting (<https://www.vogella.com/consulting/>) Company (<https://www.vogella.com/company/>)

Contact us (<https://www.vogella.com/contact.html>)

```
package de.vogella.regex.withhumb;

import org.junit.Test;

import static org.junit.Assert.assertFalse;
import static org.junit.Assert.assertTrue;

public class EitherOrCheck {
    @Test
    public void testSimpleTrue() {
        String s = "humbapumpa jim";
        assertTrue(s.matches(".*(jim|joe).*"));
        s = "humbapumpa jom";
        assertFalse(s.matches(".*(jim|joe).*"));
        s = "humbapumpa joe";
        assertTrue(s.matches(".*(jim|joe).*"));
        s = "humbapumpa joe jim";
        assertTrue(s.matches(".*(jim|joe).*"));
    }
}
```

6.2. Phone number

Task: Write a regular expression which matches any phone number.

A phone number in this example consists either out of 7 numbers in a row or out of 3 number, a (white)space or a dash and then 4 numbers.

```
package de.vogella.regex.phonenumber;

import org.junit.Test;

import static org.junit.Assert.assertFalse;
import static org.junit.Assert.assertTrue;

public class CheckPhone {

    @Test
    public void testSimpleTrue() {
        String pattern = "\\d\\d\\d\\d([,\\s])?\\d\\d\\d\\d\\d";
        String s = "1233323322";
        assertFalse(s.matches(pattern));
        s = "1233323";
        assertTrue(s.matches(pattern));
        s = "123 3323";
        assertTrue(s.matches(pattern));
    }
}
```

6.3. Check for a certain number range

The following example will check if a text contains a number with 3 digits.

Create the Java project `de.vogella.regex.numbermatch` and the following class.

6.4. Building a link checker

The following example allows you to extract all valid links from a webpage. It does not consider links which start with "javascript:" or "mailto:".

Create a Java project called *de.vogella.regex.weblinks* and the following class:

[\(https://www.vogella.com/\)](https://www.vogella.com/)[Consulting \(https://www.vogella.com/consulting/\)](https://www.vogella.com/consulting/)[Company \(https://www.vogella.com/company/\)](https://www.vogella.com/company/)[Contact us \(https://www.vogella.com/contact.html\)](https://www.vogella.com/contact.html)

```

import java.io.IOException;
import java.io.InputStream;
import java.io.InputStreamReader;
import java.io.OutputStream;
import java.io.OutputStreamWriter;
import java.io.PrintWriter;
import java.net.MalformedURLException;
import java.net.URL;
import java.util.ArrayList;
import java.util.List;
import java.util.regex.Matcher;
import java.util.regex.Pattern;

public class LinkGetter {
    private Pattern htmltag;
    private Pattern link;

    public LinkGetter() {
        htmltag = Pattern.compile("<a\\b[^>]*href=\\\"[^>]*\\\"(>.*?)"
        </a>");
        link = Pattern.compile("href=\\\"[^>]*\\\"");
    }

    public List<String> getLinks(String url) {
        List<String> links = new ArrayList<String>();
        try {
            BufferedReader bufferedReader = new BufferedReader(
                new InputStreamReader(new
            URL(url).openStream()));
            String s;
            StringBuilder builder = new StringBuilder();
            while ((s = bufferedReader.readLine()) != null) {
                builder.append(s);
            }

            Matcher tagmatch =
            htmltag.matcher(builder.toString());
            while (tagmatch.find()) {
                Matcher matcher =
                link.matcher(tagmatch.group());
                matcher.find();
                String link =
                matcher.group().replaceFirst("href=\\\"", "")
                    .replaceFirst("\\>", "")
                    .replaceFirst("\\[\\s]?target=\\\"[a-zA-
Z_0-9]*\\", "");
                if (valid(link)) {
                    links.add(makeAbsolute(url, link));
                }
            }
        } catch (MalformedURLException e) {
            e.printStackTrace();
        } catch (IOException e) {
            e.printStackTrace();
        }
        return links;
    }

    private boolean valid(String s) {
        if (s.matches("javascript:.*|mailto:.*")) {
            return false;
        }
        return true;
    }

    private String makeAbsolute(String url, String link) {
        if (link.matches("http://.*")) {
            return link;

```

6.5. Finding duplicated words

The following regular expression matches duplicated words.

```
\b(\w+)\s+\1\b
```

\b is a word boundary and \1 references to the captured match of the first group, i.e., the first word.

The (?!-in)\b(\w+)\s+\1\b finds duplicate words if they do not start with "-in".

TIP:Add (?s) to search across multiple lines.

6.6. Finding elements which start in a new line

The following regular expression allows you to find the "title" word, in case it starts in a new line, potentially with leading spaces.

```
(\n\s*)title
```

TEXT

6.7. Finding (Non-Javadoc) statements

Sometimes (Non-Javadoc) are used in Java source code to indicate that the method overrides a super method. As of Java 1.6 this can be done via the @Override annotation and it is possible to remove these statements from your code. The following regular expression can be used to identify these statements.

```
(?s) /\* \s*(non-Javadoc)\..*?\*/
```

TEXT

6.7.1. Replacing the DocBook table statement with AsciiDoc

You can replace statements like the following:

[\(https://www.vogella.com/\)](https://www.vogella.com/)
`</programlisting>`
[Consulting \(https://www.vogella.com/consulting/\)](https://www.vogella.com/consulting/)
[Company \(https://www.vogella.com/company/\)](https://www.vogella.com/company/)
[GET MORE...](#)

Corresponding regex:

[Contact us \(https://www.vogella.com/contact.html\)](https://www.vogella.com/contact.html)

```
`\s+<programlisting language="java">\R.\s+<xi:include
xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"
href="\./examples/(.*).\s+>\R.\s+</programlisting>`
```

Target could be your example:

```
`\R[source,java]\R----\R include::res/$1[]\R-----`
```

7. Processing regular expressions in Eclipse

The Eclipse IDE allows to perform search and replace across a set of files using regular expressions. In Eclipse use the `Ctrl + H` shortcut to open the *Search* dialog.

Select the *File Search* tab and check the *Regular expression* flag before entering your regular expression. You can also specify the file type and the scope for the search and replace operation.

The following screenshots demonstrate how to search for the `<![CDATA[]]>` XML tag with leading whitespace and how to remove the whitespace.

image::regularexpressioneclipse10.png[Search and replace in Eclipse part 1,pdfwidth=40%]

The resulting dialog allows you to review the changes and remove elements which should not be replaced. If you press the **OK** button, the changes are applied.
